

Sept 2012 Newsletter

1) Sound Choice has uncovered more evidence linking aborted fetal manufactured vaccines and autism disorder!

For several years we have been making people aware of the temporal association between rises in autism disorder and the introduction of vaccines made using aborted fetal cell lines. Now, we have uncovered CDC and Department of Education data that links aborted fetal manufactured vaccine use to autism disorder prevalence in every state in the US.

2) Tobacco lawyers are suing food manufacturers for incomplete labeling, yet no one is suing the pharmaceutical companies for not telling the public which vaccines contain human fetal DNA and retroviral contaminants.

I am sure that we all agree that consumers have a right to know what is in their food. Informed consumers are empowered consumers. We have federal laws that require labeling on food and other products consumed by us. Yet, there is no law, or at least no law that is being enforced, that requires pharmaceutical companies to tell us how our vaccines and drugs are being made or to tell us that some vaccines contain high levels of human fetal DNA and retroviral contaminants.

3) Introducing "I Buy FetalFree Products" merchandise

Dr. Theresa Deisher, President, Sound Choice Pharmaceutical Institute

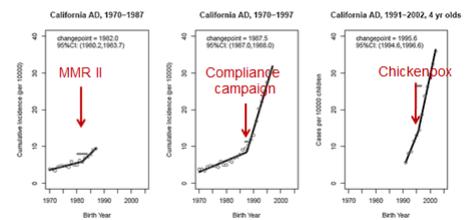

Sound Choice uncovers CDC and Department of Education data that shows chickenpox vaccine use is highly statistically related to autism disorder prevalence in every state in the US.

Over four years ago it was obvious to my eye that autism disorder rates changed dramatically in certain specific years. Looking at autism disorder prevalence data from the US Dept of Education it was clear that there were three specific years in which autism prevalence rose dramatically, and Sound Choice went on to perform the statistical analysis to show that 1980, 1988 and 1996 were 'change point' years for autism disorder. In 2010 the EPA published data confirming the 1988 change point as a worldwide autism disorder change point. As the EPA scientists point out in their publication, identification of 'change points' such as these tell us that some environmental factor was introduced that triggered such a sudden and dramatic rise in autism. Pasted at right are the 3 change points Sound Choice identified for autism disorder prevalence in the US. What environmental factor is associated with these three change points? The only childhood universal factor that is associated with all three change points is the introduction of vaccines contaminated with aborted fetal DNA and retroviral fragments. In 1979 the first aborted fetal vaccine was introduced to the US (MMRII), in

1989 a second dose of this vaccine was added and compliance doubled, and in 1995 another aborted fetal vaccine was introduced to the US (Varicella - chickenpox).

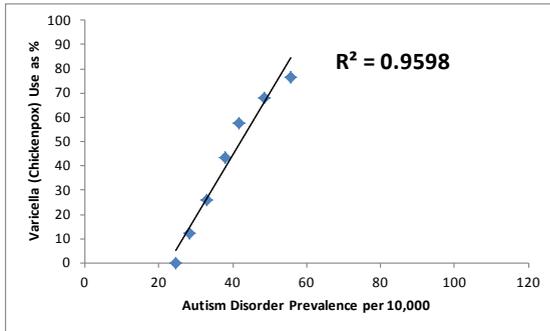

Human Fetal DNA and Retrovirus Contaminants in Vaccines Coincide with Autism Changepoints

Now, SCPI has uncovered data from the CDC and the US Department of Education that show that use of the chickenpox vaccine is directly related to autism disorder prevalence in every state in the US. The graphs on the next page show you this data. On the horizontal axis (the x axis) are the numbers of children diagnosed with autism disorder by the age of 8 who were born in 1992 through 1998 and on the vertical axis (the y axis) is the percent of children who were vaccinated against chickenpox for those same birth years. As you can see, as chickenpox vaccination rates increase, so do autism disorder diagnoses. The first graph is the average of all the US, and the second graph shows the same relationship state by state.

US autism disorder prevalence compared to Varicella use for birth years 1992 through 1998.

Data for all individual states

What the graphs above show you is that in almost every state in the US, the use of chickenpox vaccine is directly related to the number of children diagnosed with autism disorder in each year during which chickenpox vaccine use rose from 0% until it reached it's maximum use. I'll say that again, for emphasis: as more and more children were vaccinated with the chickenpox vaccine, more and more children were diagnosed with autism disorder. Statistical analysis on the data for the entire US yields a correlation coefficient (R^2) of 0.9598. For those of you who don't understand statistics, an R^2 of 0.9598 is very significant.

Let's put these results in perspective by looking at global warming for a minute. I love the environment, and I had been hugging trees for decades before global warming became the topic that it is today. The R^2 for carbon dioxide levels compared to the earth's temperature over the past 150 years is only 0.44. That's right, an R^2 of 0.44 has roused the public to become active and concerned about our environment. Shouldn't an R^2 of 0.9598 raise even more to action? What will you do with this information?

Why was Sound Choice the organization to uncover this evidence from the CDC and the Dept of Education? Why don't the CDC and the Dept of Education do this research and publish these results; results which should without a doubt lead to serious scrutiny and safety research into the cell sources that we use to manufacture

vaccines for our children? We should all be asking these questions.

In publicly available documents, for over 50 years experts at the FDA have debated the dangers of using aborted fetal cell lines to manufacture vaccines. Unfortunately for the public, in one document they are quoted as saying that they prefer to do 'intuitive' experiments. That means they preferred to talk about the potential dangers rather than doing the experiments that would have shown how dangerous using aborted fetal cell lines really was. Isn't this incredible? The FDA knows the potential danger of having fetal DNA and retroviruses contaminating our vaccines, the CDC has all the data on use of the chickenpox vaccine, and the US Department of Education has all the data on autism disorder prevalence. Yet, not one of these organizations seems to have ever looked to see how such an obvious potential trigger for autism disorder might be related to the epidemic levels of autism we are faced with.

The CDC and the FDA are organizations whose duty it is to protect the health and safety of the public. Don't they talk to each other? All I can say is thank you to those of you who have supported Sound Choice and made this research possible. We are working hard to get this new information into the hands of our elected officials and those organizations like the FDA and CDC who are charged with protecting the health of our children. We continue to rely on your support to make sure we have the means to get this information to those who need it. Don't our children deserve the same love and care we all give to the environment?

Fair Labeling and Informed Consent.

The tobacco lawyers made the national news again in August because they have filed suit against food manufacturers for false labeling. The lawyers claim that food makers are misleading consumers and violating federal regulations by falsely labeling products and ingredients. Not only are they suing for huge sums in damages, they are also asking a federal court in California to immediately stop ConAgra's sales of Pam cooking spray, Swiss Miss cocoa products and some Hunt's canned tomatoes. What have the food makers done to get the attention of the lawyers? Pam, which is a spray, does not state that it contains petroleum products, which is the propellant that allows Pam to be 'sprayed'. Another company is being sued because it lists 'evaporated cane juice' as an ingredient, rather than calling it sugar. And, in California, there is an initiative on the ballot that would require food makers to disclose genetically modified ingredients.

IN PURSUIT OF PRO-LIFE MEDICINES

I agree that genetically modified ingredients should be disclosed. I agree that calling sugar 'evaporated cane juice is misleading. I agree that most people do not know what a 'propellant' is and that Pam should have spelled it out. What this news made me ask, **really**, however, is why isn't the presence of aborted fetal DNA and retroviruses in our vaccines information that consumers have a right to know also?

While some package inserts for vaccines state that the vaccine was manufactured in MRC-5 cells or human diploid cells, no one knows that MRC-5 and human diploid cells are cells taken from aborted human fetuses. Furthermore, many of the package inserts do not disclose that the final products contain residual DNA and cellular debris from the MRC-5 cells or the other human diploid cells used to make vaccines. Here we really have 3 problem areas of disclosure as far as labeling of vaccine contents. First, parents are not given the package insert, so they have no way to even begin to get information. Second, no one knows what the MRC-5 cells or the human diploid cell lines really are, and last, the contaminants from the cell lines that are present in the final product are not disclosed. In addition to the consumer rights issues we have here, we also have a situation of simple human dignity and respect. Almost everyone, regardless of their position on women's reproductive rights, would want to know if the vaccines they are using are manufactured using electively aborted human fetal cells.

Current law requires that all 'inactive ingredients' in a vaccine be listed in the package insert. Human DNA and retrovirus fragments are certainly ingredients that should be listed and explicitly disclosed on the package insert. Despite this absence of disclosure, awareness that some vaccines are manufactured using aborted fetal cells seems to be gaining. In the past,

organizations have tried to deny the presence of contaminants from these cells. In 2006, the Canadian Coalition for Immunization Awareness and Promotion sent out a flier stating that "Vaccines do NOT contain cells from aborted fetuses." It was not until 2009 that the National Vaccine Advisory Committee acknowledged that some vaccines do indeed contain contaminating DNA and cellular debris from the aborted fetal cell lines used to produce them.

I don't know any of the tobacco lawyers, but if you do, tell them that consumers want to know what is in their vaccines just as much as they want to know whether sugar is in their foods.
